

GUIDE TO FFP1, FFP2 AND FFP3

FFP1, FFP2 and FFP3 are different classes of respirator and they offer varying levels of protection to the wearer assuming they fit and are used correctly.

Such respirators are designed to filter out particulates such as dust, liquids and fume. A simple colour-coding system exists to help you easily distinguish each product's filtering performance. FFP stands for Filtering Face Piece.

The **HIGHER** the number, the **BETTER** the protection.

FFP1 reduces the wearer's exposure to airborne particles by a **FACTOR OF 4**

FFP2 reduces the wearer's exposure to airborne particles by a **FACTOR OF 10**

FFP3 reduces the wearer's exposure to airborne particles by a **FACTOR OF 20**

Selection of the most appropriate respirator depends on the contaminant and **Workplace Exposure Level (WEL)**.

Our team of industry experts are on hand to guide you to the most appropriate solution.
